**IDENTIFICATION INFORMATION**

Write the Gehl Telescopic Handler serial number below.
Refer to the model and serial number when inquiring about parts or service from your Gehl dealer.

The model and serial numbers for this machine are on a decal located inside the operator’s station.
Chapter 1
INTRODUCTION

The information in this Operator’s Manual was written to give the owner/operator assistance in preparing, adjusting, maintaining and servicing of the Telescopic Handler. More important, this manual provides an operating plan for safe and proper use of the machine. Major points of safe operation are detailed in the SAFETY chapter of this manual.

GEHL Company asks that you read and understand the contents of this manual COMPLETELY and become familiar with the machine before operating it.

The use of this Telescopic Handler is subject to certain hazards that cannot be eliminated by mechanical means, but only by the exercise of intelligence, care and common sense. It is therefore essential to have competent and careful operators, who are not physically or mentally impaired, and who are thoroughly trained in the safe operation of the equipment and the handling of the loads.

Throughout this manual information is provided that is set in italic type and introduced by the word IMPORTANT or NOTE. Be sure to read carefully and comply with the message or directive given. Following this information will improve operating and maintenance efficiency, help to avoid breakdowns and damage, and extend the machine’s life. A chart of standard hardware torques is located in the back of this manual.

A storage pocket in the back of the seat is provided for storing the Operator’s Manual. After using the manual, please return it to the pocket and keep it with the unit at all times! If this machine is resold, GEHL Company recommends that this manual be given to the new owner.

If this machine was purchased “used,” or if the owner’s address has changed, please provide your GEHL dealer or GEHL Company Service Department with the owner’s name and current address, along with the machine model and serial number. This will allow the registered owner information to be updated, so that the owner can be notified directly in case of an important product issue, such as a safety update program.

“Right” and “left” are determined from a position sitting on the seat and facing forward.

The wide GEHL dealership network stands ready to provide any assistance required, including providing genuine GEHL service parts. All parts should be obtained from or ordered through your GEHL dealer. Give complete information about the part, and include the model and serial number of the machine. Record the serial number in the space provided on the previous page, as a handy record for quick reference.

GEHL Company reserves the right to make changes or improvements in the design or construction of any part without incurring the obligation to install such changes on any unit previously delivered.

GEHL Company, in cooperation with the Society of Automotive Engineers, has adopted this

Safety Alert Symbol

to identify potential safety hazards that if not properly avoided, could result in injury. When you see this symbol in this manual or on the machine itself, you are reminded to BE ALERT! Your personal safety is involved!

**Chapter 2**

**SPECIFICATIONS**

**Lifting Performance**

Maximum lift capacity: 5500 lbs. (2495 kg)

Maximum lift height: 19' 1" (5.8 m)

Capacity at maximum lift height: 3000 lbs. (1360 kg)

Max. forward reach to load center: 11’ (3.35 m)

Capacity at maximum forward reach: 1850 lbs. (839 kg)

Maximum below grade reach: 0" (0 mm)

**General Dimensions**

Based on standard machine equipped with listed tires, 48” masonry carriage and 48” pallet forks.

Recommended tire type: 12 - 16.5 NHS 10-ply

Overall length, less forks: 148” (3.76 m)

Overall width: 71" (1.80 m)

Overall height: 76" (1.93 m)

Ground clearance: 10.5" (266 mm)

Wheelbase: 90" (2.29 m)

Outside turn radius: 132" (3.35 m)

Machine weight: 10,000 lbs. (4536 kg)

**Instrumentation**

Gauges: Fuel level, hourmeter, coolant temperature

Monitoring lights:
- Engine oil pressure, alternator, hydrostatic drive oil temperature, engine coolant temperature

Visual indicators:
- Boom angle, frame angle

**Steering System**

Steer Valve: Fixed-displacement rotary

Displacement/Rev: 7.3 cu. in. (120 cc)

System pressure: 2400 psi (165 bar)

Steer cylinders: 1 per axle

Steer mode valve:
- 3-position, 4-way solenoid with dash-mounted switch actuation

Steer modes: 2-wheel, 4-wheel, crab

**Braking System**

Service brakes: Oil-immersed inboard hydraulic wet-disc type; front axle

Manual foot pedal actuation

Parking brake: Spring-applied, hydraulic-release disc-type in front axle

Actuation is electric switch with engine running, automatic with engine off.

**Electrical System**

Type: 12-volt, negative ground

Battery: 550 minimum cold cranking amps

Circuit protection: Fuse panel

Backup alarm: 107 dB(A)

Horn: 111 dB(A)

Alternator: 50 amp

**Service Capacities**

Cooling System: 12 qts. (11.3 L)

45/55 mixture

Anti-freeze protection: -31°F (-35°C)

Pressure cap: 15 psi (103 kPa)

Fuel tank: 17 gals. (64 L)

Hydraulic tank:
- 18 gals. (68 L)

Axles:
- Differentials: 4 qts. (3.8 L) ea.
- Planetaries:
  - Front: 27 oz. (0.8 L) ea.
  - Rear: 30 oz. (0.9 L) ea.
- Transfer Case (front axle only):
  - 8 oz. (0.23 liters)

**Hydraulic Transmission**

Type: Rexroth A4VG56DA/32

Speeds: 2 fwd / 2 rev

Travel Speeds:
- Low speed: fwd/rev 4 mph (6.4 km/h)
- High speed: fwd/rev 15 mph (24 km/h)

**Axles (front and rear)**

Type: Dana

  - Drive/steer, open differential, double-reduction planetary, full-time four-wheel drive

Overall ratio: 13.7:1

Front Model: 603-211-69

Rear Model: 221-83

**Engine**

Turbocharged Deutz TD2009 L04

140 cu. in. (2289 cc) displacement

64 hp (48 kW) @ 2600 rpm

149 ft.-lbs. (202 Nm)

torque @ 2000 rpm

Oil volume w/o filter: 8 qts. (7.5 L)

Oil volume w/ filter: 8.5 qts. (8.0 L)

Features:
- In-line 4-cylinder, direct-injection diesel fuel system, in-line fuel filter w/water trap, positive pressure lubrication, liquid pressurized cooling system, 18” (457 mm) blower fan, dry dual-element air cleaner, spin-on oil filter.

**Hydraulic System**

Type: Open-center

Pump: Single-section gear type

Displacement / revolution:
- 1.95 cu. in. (32 cc)

Flow @ 2750 RPM:
- 22 gpm (83 L/min)

Main relief pressure:
- 3350 psi (230 bar)

Steer relief pressure:
- 2400 psi (165 bar)

Hydraulic filter:
- Return type, 16-micron media, replaceable element.
- Rated flow: 35 gpm (132 L/min)
- Rated pressure: 1000 psi (70 bar)
- By-pass pressure (full flow):
  - 50 psi (345 kPa)
Chapter 3
CHECKLISTS

PRE-DELIVERY
The following Checklist is an important reminder of inspections that MUST be made before delivering the Telescopic Handler to the customer. Check off each item after the prescribed action is taken.

✓ Check that:
- NO parts of machine have been damaged in shipment. Check for such things as dents and loose or missing parts; correct or replace components as required.
- Battery is securely mounted and not cracked. Cable connections are tight. Electrolyte at proper level.
- Cylinders, hoses and fittings are not damaged, leaking or loosely secured.
- Oil, fuel and air filters are not damaged, leaking or loosely secured.
- All grease fittings have been properly lubricated and no fittings are missing; see Lubrication chapter of this manual.
- Wheel nuts are torqued to 450 ft.-lbs. (610 Nm).
- Tires are inflated to 60 psi (414 kPa) cold.
- Hydraulic system reservoir, engine crankcase, engine coolant, transmission and axles are filled to the proper operating fluid levels.
- All adjustments have been made to comply with the settings given in this manual and in the separate engine manual.
- All guards, shields and decals are in place and securely attached.
- Model and serial numbers for this unit are recorded in space provided on this page and page 1.

Start the machine and test-run the unit while checking that proper operation is exhibited by all controls.

✓ Check that:
- All indicators (lamps, switches, etc.) function properly.
- All hand and foot controls operate properly.
- Boom, Quick-attach System with attachment tool all function properly.
- No hydraulic system leaks when under pressure.
- Listen for abnormal noises or vibrations; if detected, determine their cause and repair as necessary.

I acknowledge that the pre-delivery procedures were performed on this unit as outlined above.

Dealership’s Name

Date Checklist Filled Out

Machine Model #  Machine Serial #  Engine Serial #

DELIVERY

✓ Check that:
- Review with the customer the contents of this manual and the AEM Safety Manual and the following:
  - The Index at the back, for quickly locating topics;
  - The Safety, Indicators and Controls, and Operation and Adjustments chapters for information regarding safe use of the machine.
  - The Lubrication, Service and Storage, and Maintenance chapters for information regarding proper maintenance of the machine. Explain that regular lubrication and maintenance are required for continued safe operation and long life.
  - Give this Operator’s Manual and the AEM Safety Manual to the customer and instruct them to be sure to read and completely understand their contents BEFORE operating the unit.
  - Remind the customer of U.S. OSHA regulation 1910.178 (l), which specifies operator training requirements.
  - Explain that the customer must consult the engine manual (provided) for related specifications, operating adjustments and maintenance instructions.
  - Completely fill out the Owner’s Registration, including customer’s signature, and return it to the Company.

CHECKLISTS

PRE-DELIVERY
The following Checklist is an important reminder of inspections that MUST be made before delivering the Telescopic Handler to the customer. Check off each item after the prescribed action is taken.

✓ Check that:
- NO parts of machine have been damaged in shipment. Check for such things as dents and loose or missing parts; correct or replace components as required.
- Battery is securely mounted and not cracked. Cable connections are tight. Electrolyte at proper level.
- Cylinders, hoses and fittings are not damaged, leaking or loosely secured.
- Oil, fuel and air filters are not damaged, leaking or loosely secured.
- All grease fittings have been properly lubricated and no fittings are missing; see Lubrication chapter of this manual.
- Wheel nuts are torqued to 450 ft.-lbs. (610 Nm).
- Tires are inflated to 60 psi (414 kPa) cold.
- Hydraulic system reservoir, engine crankcase, engine coolant, transmission and axles are filled to the proper operating fluid levels.
- All adjustments have been made to comply with the settings given in this manual and in the separate engine manual.
- All guards, shields and decals are in place and securely attached.
- Model and serial numbers for this unit are recorded in space provided on this page and page 1.

Start the machine and test-run the unit while checking that proper operation is exhibited by all controls.

✓ Check that:
- All indicators (lamps, switches, etc.) function properly.
- All hand and foot controls operate properly.
- Boom, Quick-attach System with attachment tool all function properly.
- No hydraulic system leaks when under pressure.
- Listen for abnormal noises or vibrations; if detected, determine their cause and repair as necessary.

I acknowledge that the pre-delivery procedures were performed on this unit as outlined above.

Chapter 4
SAFETY

The above Safety Alert Symbol means ATTENTION! ALWAYS BE ALERT! YOUR SAFETY IS INVOLVED! It stresses an attitude of safety awareness and can be found throughout this Operator’s Manual and on the machine itself.

Before attempting to operate this equipment, read and study the following safety information. In addition, be sure that everyone who operates or works with this equipment, whether family member or employee, is familiar with these safety precautions.

Gehl Company ALWAYS takes the operator’s safety into consideration when designing its machinery, and guards exposed moving parts for his/her protection. However, some areas cannot be guarded in order to assure proper operation. Further, this Operator’s Manual and decals on the machine warn of additional hazards and should be read and observed closely.

CAUTION
“CAUTION” indicates a potentially hazardous situation that, if not avoided, may result in minor or moderate injury. It may also alert to unsafe practices.

REMEMBER! It is the owner’s responsibility for communicating information on the safe use and proper maintenance of this machine! This includes providing understandable interpretations of these instructions for operators who are not fluent in reading English.

It is the responsibility of the operator to read and understand the Operator’s Manual and other information provided and use the correct operating procedure. Machines should be operated only by qualified operators.

MANDATORY SAFETY SHUTDOWN PROCEDURE

BEFORE cleaning, adjusting, lubricating or servicing the unit:

1. Stop machine on a level surface. (AVOID parking on a slope, but if necessary, park across the slope and block the tires.)
2. Fully retract the boom and lower the attachment tool to the ground. Idle engine for gradual cooling.
3. Place controls in neutral and apply parking brake.
4. Shut off the engine and remove the key.

ONLY when you have taken these precautions can you be sure it is safe to proceed. Failure to follow the above procedure could lead to death or serious bodily injury.
SAFETY

Additional Safety Reminders

✦ User/operator safety practices, as established by industry standards, are included in this Operator’s Manual and intended to promote safe operation of the machine. These guidelines do not preclude the use of good judgment, care and common sense as may be indicated by the particular jobsite work conditions.

✦ It is essential that operators be physically and mentally fit and free of mind-altering drugs and chemicals, and thoroughly trained in the safe operation of the machine. Such training should be presented completely to all new operators and not condensed for those claiming previous experience. Information on operator training is available from several sources, including the manufacturer.

✦ Some illustrations used in this manual may show doors, guards and shields open or removed for illustration purposes ONLY. BE SURE that all doors, guards and shields are in their proper operating positions before starting the engine.

Before Operation Safety Reminders

✦ Check brakes, steering, and hydraulic system prior to starting operation. Operate all controls to ensure proper operation. Observe all gauges and indicators for proper operation. If any malfunctions are found, correct the cause prior to using the machine.

✦ ALWAYS wear appropriate personal protective equipment for the job and working conditions. Hard hats, goggles, protective shoes, gloves, reflector-type vests, respirators and ear protection are examples of types of equipment that may be required. DO NOT wear loose fitting clothing, long hair, jewelry or loose personal items while operating or servicing the machine.

✦ ALWAYS check the job site for terrain hazards, obstructions and people. Remove all objects that do not belong in or on the machine and its equipment.
SAFETY

Walk around the machine and warn all personnel who may be servicing the machine or who are in the machine path prior to starting. DO NOT start until all personnel are clearly away from the machine.

Operation Safety Reminders

Any or all of the following elements may affect the stability of the machine: terrain, engine speed, type of load being carried and placed, improper tire inflation, weight of the attachment tool, and abrupt movement of any control lever. IF YOU ARE NOT CAREFUL WHILE OPERATING THIS MACHINE, ANY OF THE ABOVE FACTORS COULD CAUSE THE MACHINE TO TIP AND THROW YOU OUT OF THE OPERATOR’S STATION, WHICH MAY CAUSE SERIOUS BODILY INJURY OR DEATH!

ALWAYS wear the seat belt provided to prevent being thrown from the machine. If you are in an overturn:
- DO NOT jump!
- Hold on tight and stay with the machine!
- Lean away from the fall!

ALWAYS keep hands, feet and arms inside of the operator’s station when operating the machine!

Always look in the direction of travel. Look to the rear before backing.

ALWAYS use the recommended hand holds and steps with at least three points of support when getting on and off the machine. Keep steps and platform clean. Face the machine when climbing up and down.

DO NOT raise or drop a loaded fork or bucket suddenly. Abrupt movements under load can cause serious instability.

Study the load chart carefully. It shows maximum capacity to be lifted and placed at specific outward and upward distances. ALWAYS be aware of load weights prior to attempting lift and placement with this machine.

DO NOT exceed the machine’s rated operating capacity for the type of attachment tool being used.

DO NOT allow minors or any unqualified personnel to operate or be near the machine unless properly supervised.

DO NOT start the engine or operate any controls unless properly seated in the operator’s seat!

DO NOT run the engine in an enclosed area without providing proper ventilation for the exhaust. Exhaust gases contain carbon monoxide, an odorless and deadly gas. Internal combustion engines deplete the oxygen supply within enclosed spaces and may create a serious hazard unless the oxygen is replaced. This includes the atmosphere within the cab when equipped.

DO NOT leave the operator’s station with the boom and attachment tool raised. ALWAYS lower the boom and attachment tool to the ground, shut off the engine and engage the parking brake BEFORE leaving the operator’s station.

DO NOT drive too close to an excavation or ditch. BE SURE that the surrounding ground has adequate strength to support the weight of the machine and the load it is carrying.

DO NOT turn quickly while traveling on a slope or operate the machine beyond the grade and slope limits noted in the Operation and Adjustments chapter of the Operator’s Manual.

NEVER allow any riders on this machine or use as a lift for personnel. This is strictly a single-seat, NO passenger machine!

When road travel is required, know and use the signaling devices on the machine. Provide an escort and Slow-Moving Vehicle (SMV) emblem when required.

If necessary to park on a slope, park across the slope and block the tires.
Servicing Safety Reminders

- ALWAYS be aware of and avoid pinch-point areas on the machine, such as wheels-to-frame, cylinders-to-frame, boom- and attachment-tool-to-frame.

- NEVER attempt to by-pass the keyswitch to start the engine. ONLY use the jump-starting procedure detailed in the Service and Storage chapter.

- NEVER use your hands to search for hydraulic fluid leaks. Instead use a piece of paper or cardboard. Escaping fluid under pressure can be invisible and can penetrate the skin, causing serious injury. If any fluid is injected into your skin, see a doctor at once. Injected fluid MUST be surgically removed by a doctor familiar with this type of injury or gangrene may result.

- ALWAYS wear safety glasses with side shields when striking metal against metal. In addition, it is also recommended that a softer (chip-resistant) material be used to cushion the blow. Failure to heed could lead to serious injury to the eyes or other parts of the body.

- DO NOT refill the fuel tank when the engine is hot. Allow engine to cool down before refilling to prevent hot engine parts from igniting the fuel if it should spill or splash.

- DO NOT smoke while filling the fuel tank, working on the fuel or hydraulic systems, or working around the battery.

- DO NOT fill the fuel tank completely. Allow room for expansion. Maintain control of the fuel filler nozzle when filling the tank. Use the correct fuel grade for the operating season.

- NEVER use fuel for cleaning purposes.

- DO NOT remove the radiator cap after the engine has reached operating temperature or if it is overheated. At operating temperatures, the engine coolant will be extremely hot and under pressure. ALWAYS wait for the engine to cool before attempting to relieve pressure and remove the radiator cap. Failure to heed this warning could result in severe burns.

- DO NOT loosen or disconnect any hydraulic lines, hoses or fittings without first relieving hydraulic circuit pressure. Also, be careful not to touch any hydraulic components that have been in recent operation because they can be extremely hot and can burn you!

- Avoid lubrication or mechanical adjustments with the machine in motion or the engine running. If the engine must be running to make certain adjustments, place the equipment in a safe position, place the transmission in neutral, apply the parking brake, securely block the wheels and use extreme caution.

- To ensure continued safe operation, replace damaged or worn-out parts with genuine Gehl service parts before using this equipment.

Modifications, Nameplates, Markings and Capacities

- Modifications and additions that affect capacity or safe operation must never be performed without the manufacturer’s prior written approval. Where such authorization is granted, any applicable markings are to be changed accordingly.

- All attachment tools MUST be marked to identify the attachment tool and the total capacity with the attachment tool at maximum elevation with the load laterally centered.

- ALWAYS be sure all nameplates, warnings and instruction markings are in place and legible. Local government regulations may require specific decals, which are the responsibility of the owner to provide.
Safety Guards and Warning Devices

This machine is fitted with a Roll-Over Protective Structure (ROPS) and Falling Object Protective Structure (FOPS) in accordance with industry standards. The structure is intended to offer protection to the operator in case of an overturn and from falling objects, but it cannot protect against every possible hazard. Therefore it should not be considered a substitute for good judgment and safe practices in operating the machine. If the ROPS / FOPS structure is damaged, it must be replaced to restore the protection it provides.

This machine is equipped with a horn and backup alarm. The user must determine if operating conditions require the machine to be equipped with additional devices (mirrors, rotating beacon, etc.) and be responsible for providing and maintaining such devices.
SAFETY

![WARNING]

**WARNING**
- PINCH POINT HAZARD
  - Keep clear when engine is running.
  - Follow Mandatory Safety Shutdown Procedure before servicing.

![WARNING]

**WARNING**
- RUN-OVER HAZARD
  - DO NOT bypass starter solenoid.

![WARNING]

**WARNING**
- FALL HAZARD
  - DO NOT use this machine to lift people or work platforms.

![WARNING]

**WARNING**
- HOT LIQUID HAZARD
  - DO NOT remove hot radiator cap.
  - Allow engine to cool before servicing.

- Keep hands away when engine is running.
- Stop engine and allow it to cool before servicing.

**RED**
GUARDS AND SHIELDS
Whenever possible and without affecting machine operation, guards and shields are used to protect potentially hazardous areas. In many places, decals are also provided to warn of potential hazards and to display special operating procedures.

WARNING
Read and thoroughly understand all safety decals on the Telescopic Handler before operating it. DO NOT operate the machine unless all factory-installed guards and shields are properly secured in place.
**DASH PANEL AREA**

**Key Switch, Start and Horn Buttons**

**A1 - Key switch OFF:** When the key is vertical in the keyswitch, power is disconnected from the battery to the control and instrument panel electrical circuits. Also, this is the only position in which the key can be inserted or removed.

**A2 - Key switch ON:** When the key is turned one position clockwise from the vertical (OFF) position, power from the battery is supplied to all control and instrument panel electrical circuits.

**B - Electrical Engine Preheat:** To activate the engine preheat, turn the keyswitch completely to the right against the spring load. The engine preheat indicator will light.

**C - Start Button:** With keyswitch in ON position, press the button to activate the starter. Release it as soon as the engine starts.

**NOTE:** If the engine requires repeated attempts to start, the key MUST be returned to the OFF position between starting attempts to prevent battery run down.

**IMPORTANT:** Do not use additional starting aids such as ether injection when using the electrical engine preheat.

**D - Horn Button:** With the keyswitch ON, press the horn button to activate warning sound.

**Load Zone Charts:** A set of flip charts show lift height and reach limits relative to the load weight being handled with various attachment tools.

**Fuel Level Gauge:** The upper left gauge in the instrument panel, it indicates the amount of fuel remaining in the fuel tank.

**Coolant Temperature Gauge:** The upper right gauge in the instrument panel, it indicates the temperature of the engine coolant. Under normal conditions, this gauge should indicate approximately 185°F (85°C).

**Lamp Cluster Gauge:** The lower left gauge in the instrument panel, it contains four indicator lamps. The functions of these lamps are as follows:

- **Engine Temperature Lamp:** Located in the upper left quadrant of the lamp cluster gauge, this lamp lights when the engine coolant temperature is too high. During normal operation, with the engine running, this lamp should be off. During starting and when the engine is not running, this lamp will be on.

- **Engine Oil Pressure Lamp:** Located in the upper right quadrant of the lamp cluster gauge, this lamp indicates whether the engine lubricating oil pressure is sufficient. During normal operation, with the engine running, this lamp should be off. During starting and when the engine is not running, this lamp will be on.
IMPORTANT: If this lamp comes on during normal operation with the engine running, stop the engine immediately! After allowing the oil to drain down for a few minutes, check the engine oil level. Maintain oil level between the marks on the dipstick.

Alternator Lamp: Located in the lower left quadrant of the lamp cluster gauge, this lamp indicates the condition of the electrical charging system. During normal operation, this lamp should be off. If the charge rate is too high or too low, this lamp will come on.

Hydrostatic Transmission Oil Temperature Lamp: Located in the lower right quadrant of the lamp cluster gauge, this lamp lights when the transmission oil temperature is too hot. During normal operation this lamp should be off, indicating that the transmission oil is at the proper temperature.

IMPORTANT: If this lamp comes on during normal operation, a problem may exist in the hydrostatic transmission. Stop the machine immediately and investigate the cause of the problem!

Hourmeter: Located to the right of the lamp cluster gauge, it indicates the total operating time of the machine and should be used for keeping the maintenance log.

Top Row Switches and Indicator

Switches have graphic symbols to indicate function and effect. The following mode descriptions start with the first switch on the left.

A - Steering Mode: This 3-position switch is used to select among the three steering modes. The upper position selects the 4-wheel steering mode. This mode selects all-wheel steering for making tighter turns, usually on a jobsite. The center position selects the 2-wheel steering mode. This mode selects front wheel steering only, used for higher speed travel. The lower position selects the crab steering mode. This mode is used when a small amount of side shift is needed for picking or placing a load.

NOTE: The rear wheels are not self-centering. Make sure all wheels are in a straight-ahead position before changing the steering mode.

Any of the steering modes can be used in both forward and reverse travel. The operator should learn to anticipate changes in machine movement if the steering mode must be changed.

B - High/Low Speed: This switch is used to select the travel speed. Press the top of the switch to select low speed, used for load pickup and placement, or whenever low speed operation is desired. Press the bottom of the switch to select high speed, used for road travel.

IMPORTANT: Be sure machine is stopped before changing travel speeds.

C - Engine Preheat Indicator: When lighted this lamp indicates that the cold weather starting aid is in use.

D - Parking Brake: When the machine is parked, this switch should be pressed to actuate the parking brake mechanism in the front axle.

WARNING

Unattended machine hazard.

Activate parking brake switch and lower attachment tool to ground before leaving machine. An unattended machine can move or roll and cause death or serious injury to operator or bystanders.

Periodically check the parking brake operation to verify that it has adequate holding power. Always be sure the parking brake switch is off when resuming machine operation.
Middle Row Switches
Switches have graphic symbols to indicate function and effect. The following mode descriptions start with the first switch on the left.

NOTE: Some switches are optional and may not be on machine.

E - Hazard: This switch can be activated to make the tail lights flash on and off in case the machine is stalled or temporarily stopped in a traffic area on the road or jobsite.

F - Turn Signal: This switch is used to indicate the direction of a turn with the tail lights. Press the right arrow for a right turn; press the left arrow for a left turn. Return the switch to the center position after the turn is completed.

G - Head Lights/Work Lights: Pressing the top of the switch will illuminate the lights mounted on the top of the operator’s station and the red tail lights for forward travel operations. Pressing the bottom of the switch will illuminate the lights at the end of the boom in addition to the lights on the operator’s station for additional lighting in working operations.

H - Option

Bottom Row Switches
Switches have graphic symbols to indicate function and effect. The following mode descriptions start with the first switch on the left.

I and J - Wiper/Washer: The windshield and top window of the operator’s station are each equipped with a wiper and washer mechanism. The left switch operates the wiper and washer on the windshield; the second switch operates the wiper and washer on the top window.

K and L - Option

Heater Controls

Temperature Control: This is the upper knob located to the left of the steering wheel. This knob is used to adjust the temperature output of the cab heater. Turning the knob clockwise will increase the temperature output.

Fan Speed: This knob is located below the temperature control knob. Rotating the knob clockwise will increase the fan speed for increased air circulation.

Travel Lever
Located on the left side of the steering wheel column, this lever is used to change travel direction (forward or reverse).

Position “F” (FORWARD)

Position “N” (NEUTRAL)

Position “R” (REVERSE)

NOTE: The lever MUST be in N (Neutral) position before the starter will engage to start the engine.
IMPORTANT: Care should be taken when changing direction, because damage to the hydrostatic transmission can occur if shifting is forced or attempted at too high a speed. Allow machine speed to slow before any directional change is attempted.

NOTE: Backup alarm automatically sounds with travel lever in reverse.

Steering
The power steering system is designed to provide low-effort steering without shock reaction from the axle wheels to the steering wheel. Turn the steering wheel to the right or left to turn the machine in that direction.

FLOOR AND SEAT AREA

Throttle Pedal: This is right-foot operated and controls the engine speed to match increased power requirements. Pushing down on the pedal increases the RPM; letting up on the pedal decreases RPM.

Service Brake Pedal and Transmission Cut-off: Pressing the brake pedal hydraulically activates the internal braking mechanism in the front axle. During initial brake pedal travel and as the brake pedal is pressed farther, power to the transmission is progressively cut off. This allows faster engine speeds at slower operating speeds while maintaining power to the hydraulic system.

Seat Positioning: The seat is mounted on rails for forward and rearward repositioning to accommodate the operator’s size. A spring-loaded latch handle under the front of the seat activates the adjustment mechanism.

Suspension Seat (optional): In addition to the “A” latch handle for forward and rearward adjustment, this seat has a knob “B” under the front of the seat to adjust the suspension. Turn the knob to the right for a softer ride, and to the left for a firmer ride.

Seat Belt: This machine has a retractable seat belt. Grasp the belt on the left side of the seat pulling the belt over your lap and inserting the belt into the buckle on the right side of the seat until you hear it lock in place.

RIGHT SIDE PANEL

These controls are used to position the boom and attachment. Graphic symbols indicate the control actions.

Boom Control Joystick: This machine has a hydraulic-type telescopic boom. The boom section extends by means of a hydraulic cylinder inside the boom.

To extend the boom, move the joystick handle to the right; to retract the boom, move the joystick handle to the left. To raise the boom, move the joystick handle rearward; to lower the boom, move the joystick handle forward.
Attachment Tilt/Auxiliary Hydraulics Joystick: To tilt the attachment tool up, move the joystick handle rearward; to tilt the attachment tool down, move the joystick handle forward. When the operator tilts the attachment tool to a desired angle, that angle will be maintained as the boom is raised and lowered, extended and retracted, until a new angle is set.

Move the joystick handle to the left or right to operate the additional hydraulics required on some attachment tools.

FUNCTION INDICATORS

Frame Angle Indicator: Located in front of the operator on the ROPS upper cross tube, this indicator enables the operator to check if the Telescopic Handler is at a safe angle for operation.

Boom Angle Indicator: Mounted on the left side of the outer boom, the position of the ball shows the angle of boom elevation relative to the ground.

SERVICE AND SAFETY FEATURES

The following indicators are for checking fluid levels.

Engine Oil Level: The dipstick is located on the right side of the engine.

Hydraulic Reservoir Oil Level and Fill Cap: The hydraulic oil level sight gauge is located under the engine cover on the firewall toward the front of the engine compartment. The hydraulic oil fill cap is located under the engine cover toward the front, just to the rear of the hydraulic oil cooler.
Coolant Level: The coolant recovery tank is located under the engine cover toward the front and above the engine.

Hydraulic Restriction Indicator: This indicator is located on the hydraulic filter assembly under the engine cover. (Refer to Checking and Changing Hydraulic Return Filter Element, page 46.)

Battery: The battery is located under the engine cover toward the front of the engine compartment.

Backup Alarm: Located under the frame above the rear axle; it produces a loud warning sound whenever the machine is in reverse.

Air Filter Restriction Indicator: This indicator is located on the outlet of the air filter housing. (Refer to Checking and Changing Air Filter Element, page 49.)

Hydraulic Pressure Test Port: Located off the rear of the battery tray; a gauge can be attached to this port to check main valve and steering pressures.

Right Side Rear View Mirror: Located on the right side of the machine; it provides the operator a view of the area on the right side and behind the machine.

Left Side Rear View Mirror (optional): Located on the left side of the cab; it provides the operator a view of the area on the left side and behind the machine.
**Cab Right Side Window or Panel:** Located on the right side of the cab; this window or panel protects the operator from coming in contact with the boom.

**Cab Rear Window:** Located on the rear of the cab; this window protects the operator from material flying off the rear wheel.

**Front Window Emergency Exit:** When equipped with the optional fully enclosed cab, the front window serves as an emergency exit. Pull the pin on each window hold-open, then push the window open and exit.

**Fuse and Relay Compartment:** Located under the hinged load chart panel; lift the front of the panel to access the fuses and relays.

**Fuse and Relay Functions:** Refer to the illustration and following description for the fuse and relay functions.

**FUSES:**
1. 15 AMP Fuse: ignition switch, horn, brake lights, glow plug
2. 20 AMP Fuse: transmission, neutral start, park brake, steer mode, injector pump, backup alarm
3. 15 AMP Fuse: lights, turn signals, hi/low speed
4. 25 AMP Fuse: gauges, heater
5. 25 AMP Fuse: top wiper motor
6. 25 AMP Fuse: front wiper motor

**RELAYS:**
A. 40 AMP Change-over Relay: park brake
B. 40 AMP Change-over Relay: ignition
C. 20 AMP Relay: top wiper
D. 20 AMP Relay: lights
E. 20 AMP Relay: bulb check
F. 20 AMP Relay: front wiper
ATTACHMENT TOOLS
Gehl offers a versatile range of attachment tools to meet various lifting and material handling applications. Contact your Gehl dealer for specifications and ordering information.

ACCESSORIES
Gehl offers a range of special accessories for this machine. Contact your Gehl dealer for specifications and ordering information.

NOTE: All accessories are field-installed unless otherwise noted. Information and parts for installing accessories are provided by the Gehl Company or Gehl Telescopic Handler dealers.
Chapter 6

OPERATION AND ADJUSTMENTS

GENERAL INFORMATION

ENGINE BREAK-IN
A new engine does not require extensive “break-in.” However, for the first 100 hours of operation, follow these guidelines: Allow the engine to idle for a few minutes after every cold start. DO NOT idle the engine for long periods of time. DO NOT operate the engine at maximum power for long periods of time. Check the oil level frequently and replenish as necessary with the oil specified in the engine manual.

Deutz engines do not use a “break-in” oil. After the first 100 hours of operation, change the oil and replace the oil filter. Consult the Lubrication chapter for the type and grade of oil to use. Refer to the Service and Storage chapter for the proper service intervals.

PRE-START INSPECTION
It is the operator’s responsibility to inspect the machine before the start of each workday. Every pre-start inspection must include more than checking the fuel and oil levels. It is a good practice to personally inspect any machine you are assigned to use, even though it has already been put into service by other personnel.

The most efficient method of checking a machine is by conducting a “Walk-Around Inspection.”

Before mounting the operator’s compartment, walk completely around the machine to be sure no one is under, on, or close to it. Let others in the area know you are going to start up and wait until everyone is clear of the machine.

BEFORE STARTING ENGINE

Before starting the engine and running the machine, refer to the Indicators and Controls chapter and become familiar with the various operating controls, indicators and safety features.

STARTING THE ENGINE

IMPORTANT: Crank the starter until the engine starts. If the engine fails to start within 20 seconds, return the key to the “OFF” position, wait 2 minutes, and try again to start the engine. Cranking the engine for longer than 20 seconds will result in premature failure of the starter.

1. Grasp the hand holds to step up into the operator’s compartment.
2. Adjust the seat and fasten the seatbelt.
3. Check that all controls are in their “neutral” positions, except the parking brake switch, which should be in the “ON” position.
4. Turn the key switch to “ON” position and press the start button. If the button is released before the engine starts, turn the keyswitch to “OFF” position and allow the starter to stop before attempting to start again.

WARNING
ALWAYS fasten your seat belt before starting the engine. Leave the parking brake applied until the engine is running and you are ready to operate the machine.

The following procedure is recommended for starting the engine:

5. After the engine starts, allow a sufficient warm-up time before operating the controls.
6. Check that indicators are in normal condition.
7. Check that there are no fuel, oil or engine coolant leaks, and no abnormal noises or vibrations.
COLD STARTING

A block heater is recommended for starting in temperatures of 20°F (-7°C) or lower.

If the battery becomes discharged and does not have sufficient power to start the engine, jumper cables can be used for starting assistance. Refer to the jump starting instructions in the Service and Storage chapter of this manual for safe jump starting procedures.

COLD STARTING PROCEDURES

**WARNING**

Do not use starting fluid (ether) with engine preheat systems. An explosion can result, which can cause engine damage, injury or death.

If prevailing temperature is 32°F (0°C) or below, it may be necessary to use a cold weather starting aid to start the diesel engine.

1. Turn the key switch completely to the right against the spring load to activate the engine preheat. The engine preheat indicator lamp located in the switch panel will light.
2. Hold the key in this position for approximately one minute.
3. While holding the key in the preheat position, press the start button to start the engine.
4. Release the key and start button when the engine starts.

STOPPING

The following procedure is the recommended sequence for stopping the machine:

1. Bring the machine to a stop on a level surface. Avoid parking on a slope, but if necessary, park across the slope and block the tires.
2. Fully retract the boom and lower the attachment to the ground. Idle the engine for gradual cooling.
3. Place controls in neutral. Apply the parking brake.
4. Turn the ignition switch key to the “OFF” position. Remove the key.
5. Unfasten the seatbelt, and grasp the hand holds while climbing out of the operator’s compartment.

FIRST TIME OPERATION

**CAUTION**

Be sure the area used for test-running is clear of spectators and obstructions. Initially, operate the machine with an empty attachment tool.

Make sure the engine is warm and then go through the following procedures:

Select the travel direction. Switch off the parking brake and move ahead slowly, while testing the steering and brakes. Stop and operate all boom and attachment tool function controls, checking for smooth response.

Apply the service brakes, stop the machine and move the travel lever to the opposite direction.

**IMPORTANT:** To prevent damage to the transmission, the Telescopic Handler should be traveling at a slow speed and not accelerating when changing the direction of travel.

PARKING BRAKE

**NOTE:** The parking brake mechanism within the front axle is NOT designed for, OR intended to be used as, the primary means of stopping movement of the machine. Hydraulic braking provided through the service brakes within the axles is the primary means for stopping movement. The axle-by-axle split brake system is the secondary means of stopping movement.

The proper sequence for correct machine operation is to always engage the parking brake switch before shutting off the engine; and to disengage the parking brake ONLY after the engine is running. In an EMERGENCY, if it becomes necessary to stop the machine, activate the parking brake switch to “ON.”

CHANGING ATTACHMENT TOOLS

The Telescopic Handler boom nose will accept Gehl Quick-attach System attachment tools. The Quick-attach System has a quick-release hookup and locking mechanism for mounting framing-type or masonry-type attachment tools to the boom nose.

**Attaching**

To pick up the attachment tool, proceed as follows:
1. Raise the boom slightly, extend it 2 to 3 feet (600-900 mm) for better visibility, and tilt the Quick-attach System forward.

2. Align the Quick-attach System squarely with the back of the attachment tool.

3. Slowly extend the Quick-attach System and lower the hooks under the attachment tool hookup bar.

4. Tilt the Quick-attach System back so that the lock plate engages the attachment tool. This secures the attachment tool to the Quick-attach System.

5. For an attachment tool with auxiliary hydraulics, connect hoses to the quick-disconnect connectors on the boom nose.

---

**Detaching**

To detach attachment tool, proceed as follows:

1. Raise the boom slightly and extend it 2 to 3 feet (600-900 mm) for better visibility. Lower the boom until the attachment tool is approximately 12” (300 mm) off the ground.

2. Roll the carrier rearward as far as it will go. When the carrier is rolled all the way back, perform the Mandatory Safety Shutdown Procedure (p. 8, Safety chapter).

3. With the engine off, leave the operator’s station. Manually raise the lock spring, and flip the lock plate up and outward at least 180° so it is in position to re-lock on the next attachment tool.

4. Tilt the Quick-attach System forward to allow the attachment tool to roll out, then lower the boom so the hook ears clear the hookup bar on the attachment tool.

**NOTE:** *One side of the lock plate has a bright red decal to indicate the unlocked position.*

5. If the attachment tool has auxiliary hydraulics, disconnect the hoses from the quick-disconnects on the boom nose.

6. Start the engine and tilt the Quick-attach System forward, then slowly back the machine until the attachment tool is free from the boom nose.

---

**SELF-LEVELING**

The machine is equipped with a hydraulic self-leveling feature. This feature is designed to keep the attachment tool level while the boom is being raised and lowered.

---

**GENERAL MACHINE OPERATION**

Check the Telescopic Handler to be sure all systems are in good operating condition. Perform the following steps before starting the machine the first time each day:

---

---

**WARNING**

Modifications, alterations to, or use of attachment tools not authorized by Gehl (or the manufacturer) in writing can void warranty and cause machine damage and/or serious personal injury or death.
1. Check the engine oil, coolant and hydraulic oil levels.

2. Check hydraulic oil cooler and engine radiator for debris.

3. Be sure weekly lubrication has been done.

4. Visually inspect for leaks and broken or malfunctioning parts. Be sure all caps, covers and safety shields are in place.

5. Check tires for cuts, bulges, nails, correct pressure, loose wheel nuts, etc.

6. Inspect the work area. Be sure you know where you will make load pickups, lifts and turns. Look over the terrain of the jobsite for holes, obstacles, slippery surfaces, and soft or deep mud.

7. Check clearances of ramps, doorways and passage-ways. Check overhead clearances if you will travel and place loads near power or telephone lines.

---

**WARNING**

Exhaust fumes can kill. Ensure proper ventilation when starting indoors or in enclosed areas.

Use proper hand holds, NOT the steering wheel or control levers when mounting and dismounting.

NEVER operate the machine with safety guards or covers removed.

Over-inflated tires can explode and cause injury or death. Tire repairs MUST be made only by authorized personnel using proper tools and equipment.

---

If the machine is in need of repair or in any way unsafe, or contributes to an unsafe condition, the matter must be reported immediately to the user’s designated authority. The machine must NOT be operated until it has been restored to a safe operating condition.

Operate the travel controls gradually and smoothly when starting, stopping, turning and reversing direction.

**Grade and Slope Precautions**

The Telescopic Handler complies with industry stability test requirements and is stable when properly oper-
4. DO NOT travel across a side hill that exceeds 18% or 10° grade. Check the frame angle indicator on the ROPS/FOPS cross member to determine the angle of the grade. The attachment tool MUST be maintained at the “carry” position, with the boom fully retracted and attachment tool at minimum ground clearance.

When ascending or descending grades in excess of 5% or 3°, the machine should be driven with the load upgrade. An unloaded machine should be operated on all grades with the load handling attachment tool downgrade, tilted back if applicable, and raised only as far as necessary to clear the ground surface.

Avoid turning if possible and use extreme caution on grades, ramps and inclines. Normally travel straight up and down the slope.

**Traffic Flow Patterns**

Know and understand the traffic flow patterns of your jobsite. Know all Telescopic Handler hand signals for safety. Use signal persons as necessary for safe operation, and be sure you can see the signal person and acknowledge the signals given.

**Safety Hand Signals**

When ramps must be used in transporting loads with the machine, the following are the minimum widths for safe travel:

- Compacted dirt, gravel, etc. 12 ft. (3.6 m)
- Woodboard, concrete, etc. 10 ft. (3.0 m)

Permanent aisles, roadways and passageways, floors and ramps must be clearly defined or marked. Permanent or temporary protrusion of loads, equipment, material and construction facilities into the usual operating area must be guarded, clearly and distinctively marked, or clearly visible.

Maintain a safe distance from the edge of ramps, platforms and other similar working surfaces.

Controlled lighting of adequate intensity should be provided in operating areas. Where operating conditions indicate, the operator/user is responsible for having the machine equipped with lights.

Provisions must be made to prevent trucks, semi-trailers and railroad cars from being moved during loading and unloading.

Wheel stops, parking brakes, or other positive holding means must be used to prevent movement during loading and unloading.
DO NOT move railroad cars and trailers with the Telescopic Handler.

DO NOT use the boom and attachment for leverage to push the machine out of mud.

**IMPORTANT:** DO NOT lower boom at high engine speed when attachment tool is at maximum rearward tilt, because damage to slave cylinders may result.

**GENERAL LOAD HANDLING**

NEVER attempt to work controls except from the operator’s seat. NEVER jerk or use fast movements. Avoid sudden stops, starts and changes in direction.

Operation of the hydraulic system depends on engine speed and the distance the controls are moved. When operating these controls it is important to develop a technique called “feathering.” Feathering the control means starting the desired motion by moving the control a small amount away from neutral. Then after movement has started, the control can be eased to full movement. Use the same feathering technique to stop the motion.

---

**WARNING**

Excessive speed can be hazardous. ALWAYS exercise caution and good judgement while operating the machine.

ALWAYS maintain a safe distance from electric power lines and avoid contact with any electrically charged conductor and gas line. It is not necessary to make direct contact with a power line for power to ground through the structure of the machine. Keep the boom and load at least 10 ft. (3 m) from all power lines. Accidental contact or rupture can result in electrocution or an explosion. Contact the North American One-Call Referral System at (888) 258-0808 for the local “Digger’s Hotline” number or proper local authorities for utility line locations BEFORE starting to dig!

Keep all body parts inside the operator’s station while operating the machine. BE SURE of clearance for the attachment tool when turning, working around buildings, etc.

Turning corners too fast can tip the machine, or cause a load to tip off the attachment. Sudden slowing or stopping of the machine may cause the load to drop off the attachment tool.

Be certain you can control both speed and direction before moving. Always place the machine in neutral and set the parking brake before raising or extending the boom. NEVER drive the machine up to someone standing in front of the load.

NEVER leave the operator’s station without first lowering the attachment tool to the ground. Then set the parking brake, place controls in neutral, shut off engine and remove the key. AVOID parking the machine on a slope, but if necessary, park across the slope and block the tires.

**Load Capacity and Reach**

This machine has flip-charts in the operator’s station that provide the load capacity limits at various positions of attachment tool extension and elevation. A set of the load zone charts is reproduced at the end of this manual for reference.

A typical load zone chart is shown on the next page. The scale on the left indicates height in feet above the ground level. The scale on the bottom shows the distance in feet out from the front of the machine. The arc lines noted by the numbers “1” through “4” correspond to the position extension markers on the operator side of the inner boom section.
The following example illustrates proper use of the load zone charts for the Telescopic Handler:

**Example:**
The operator, using a standard carriage attachment tool, wants to raise a 4000 pound load 10 feet high, and can only get to within 5 feet of the load placement point. Can it be done within the capacity of the machine?

**Analysis:** See “Typical Load Zone Chart” below.

Projecting up from the 5-foot mark on the horizontal axis to intersect a line through the 10-foot mark on the vertical axis shows the load can be placed in the 4000 pound zone.

During placement, the operator observes when the extension reference number “2” on the boom becomes visible and stops. The maximum safe distance of extension with this load has been reached.

**WARNING**

NEVER exceed the rated operating capacity of the Telescopic Handler as shown on the load zone charts.

**LIFTING ATTACHMENT TOOL APPLICATIONS**

**Picking Up the Load**
Inspect the load. If it appears unstable, DO NOT attempt to move it. DO NOT attempt lifting double-tiered loads, or straddling side-by-side pallets with one on each fork. NEVER add extra unauthorized counterweights to this machine.

**WARNING**
Operating conditions can reduce the machine’s safe operating capacity. Exceeding the capacity when raising or extending the boom will cause the machine to tip forward.

Approach the load squarely and slowly with the machine straight and level. Adjust the space between forks, if necessary. Engage the load equally on both forks until the load touches the carriage backrest. Tilt the forks back to position the load for travel.

**Carrying the Load**
If the load obstructs your view, get someone to direct you. Maintain ground speeds consistent with ground conditions and which permit stopping in a safe manner.

**WARNING**
NEVER travel with the boom above the carry position (attachment tool should be at minimum ground clearance). Boom should be fully retracted.

NEVER coast with the transmission in neutral. Travel up and down grades slowly.

DO NOT operate the machine on a slope or grade that exceeds 22% or 12°.
Elevating and Placing the Load

For ground level placement, be sure the area under the load and around the machine is clear of equipment and personnel. Lower the load to the ground, tilt the forks to the horizontal position, and then back away carefully to disengage the forks from the load.

**WARNING**

DO NOT raise the boom until you check the frame angle indicator to verify that the ball is in a safe zone for raising and placing a high load.

For elevated or overhead placement, bring the machine as close as possible to the landing point. Use extreme caution for high placement. Be sure personnel are clear of the area.

**WARNING**

Be sure that the surrounding ground has adequate strength to support the weight of the machine and the load it is carrying.

Always wear the seat belt provided to prevent being thrown from the machine. If you are in an overturn:
- **DO NOT** jump!
- Hold on tight and stay with the machine!
- Lean away from the fall!

Set the parking brake, hold the service brake pedal fully applied and slowly raise the load, maintaining a slight rearward tilt to cradle the load. As the load approaches the desired height, feather the boom control at minimum speed until the load is slightly higher than the landing point.

Continue the feathering technique and lower the load into place. Free the forks from the load by alternately retracting and raising the boom. If this process is not possible, very slowly and carefully reverse the telescopic handler to free the forks from the load. Lower the forks to travel height.

**WARNING**

The machine becomes less stable as the load is raised higher. As lift height increases, the operator's depth perception decreases. High elevation placements may require a signal person to guide the operator.

DO NOT ram the lift cylinders to the end of the stroke. The resulting jolt could spill the load.

The truss boom attachment tool should ONLY be used to lift and place loads when the machine is in a stationary position. DO NOT use to transport loads around the jobsite. This can cause the load to swing, resulting in either the load dropping or the machine tipping over.

If a hydraulic boom circuit hose bursts with the boom up, shut down the machine and call your Gehl dealer. DO NOT attempt to lower the boom or make repairs.

**SUSPENDED LOADS**

The handling of suspended loads by means of the truss boom or other similar device can introduce dynamic forces affecting the stability of the machine that are not considered in the stability criteria of industry test standards. Grades, sudden starts, stops and turns can cause the load to swing and create a hazard.

DO NOT exceed the Telescopic Handler capacity for handling suspended loads. Only lift the load vertically; NEVER drag it horizontally. Use tag lines to restrain load swing whenever possible.

**Guidelines for “Free Rigging / Suspended Loads”**

1. The rigging equipment must be in good condition and comply with the applicable U.S. OSHA regulation, 1910.184, “Slings,” or 1926.251, “Rigging equipment for material handling.”

2. The rigging equipment must be secured to the forks such that it cannot slip or slide either sideways or fore and aft.

3. The capacity of the fork(s) and the machine (whichever is less) must not be exceeded.

4. The load center must remain at 24” (610 mm) or less.

5. No lifting of material may be done when anyone is on the load, rigging or forks.
6. Multiple pickup points on the load are preferred to prevent the load from rotating, but a single pickup point may be used if one or more tag lines are utilized. And, of course, the load must never be positioned over personnel at any time.

**ROAD TRAVEL**

For short distance highway travel, attach a Slow-Moving Vehicle (SMV) emblem (purchased locally) to the rear of the Telescopic Handler. For highway operation, obtain and install an amber flashing beacon.

**NOTE:** ALWAYS follow ALL state and local regulations regarding the operation of equipment on or across public highways. Whenever there is an appreciable distance between jobsites, or if driving on public highway is prohibited, transport the machine using a vehicle of appropriate size and capacity.

**TRANSPORTING BETWEEN JOBSITES**

ALWAYS abide by the following recommended procedures and guidelines when using ramps to load the machine onto (and unload it from) a truck or trailer. Failure to heed can result in damage to equipment and serious personal injury or death!

Tie-down points are provided for inserting chains to secure the machine during transport.

**Loading Machine Using Ramps**

**NOTE:** A matched pair of ramps is required.

1. The ramps MUST be of sufficient strength to support the machine. Whenever possible, the use of strong steel ramps is recommended as well as center supporting blocks.

2. The ramps MUST be firmly attached to the truck or trailer bed with NO step between the bed and the ramps.

3. Incline of ramps MUST be less than 15 degrees. Ramp length MUST be at least 16 feet (4.9 m) long.

4. Ramp width MUST be at least 1-1/2 times the tire width.

5. Block the front and rear of the tires on the truck or trailer; engage the parking brake.

6. Position the machine with the boom facing toward the front of the truck or trailer so that it is straight in line with the ramps. Slowly (at the lowest engine speed possible) and carefully drive the machine up the ramps.

7. Tie-down points are provided at the front and rear corners of the frame structure.

---

**WARNING**

NEVER adjust travel direction (even slightly) while on the ramps. Instead, back off the ramps, and then realign the machine with the ramps.

---

**WARNING**

NEVER transport the machine with the boom raised or extended. BE SURE to secure the machine (including boom) to the truck or trailer bed using chain and binders or steel cables, to prevent any movement while transporting.

**Unloading Machine Using Ramps**

**NOTE:** A matched pair of ramps is required.

Repeat Steps 1 through 5 and proceed as follows to unload the machine:

6. Remove the tie-down chains/cables.

7. If necessary, adjust the machine so that the wheels are in line and centered with the ramps.

8. Slowly (at the lowest engine speed possible) and carefully drive the machine down the ramps.
LIFTING THE TELESCOPIC HANDLER

The Telescopic Handler can be lifted using the four lifting points shown above.

Lift equipment used and its installation is the responsibility of the party conducting the lift. All rigging must comply with applicable regulations and guidelines.

1. Using suitable lift equipment, hook into the lift eyes. Adjust the length of the slings or chains to lift the telescopic handler level.

   IMPORTANT: As needed, use a spreader bar to prevent the slings or chains from rubbing the sides of the boom.

2. Center the hoist over the Telescopic Handler. To prevent shock loading of the equipment and excessive swinging of the load, slowly lift the Telescopic Handler off the ground. Perform all movements slowly and gradually. As needed, use a tag line to help position the Telescopic Handler.

TOWING THE TELESCOPIC HANDLER

If the machine becomes disabled, it can be towed for a short distance. To tow the Telescopic Handler, the high pressure limiters on the hydrostatic transmission must be unlocked and the SAHR parking brake must be released.

---

**WARNING**

Do not tow the Telescopic Handler at more than 3 mph (5 km/h), and only for short distances (less than 100 yards).

Hydrostatic Transmission Unlocking Procedure

1. Remove the plastic caps on the high pressure limiters.

2. Loosen the jam nut on a high pressure limiter.

3. While holding the jam nut, use an Allen wrench to turn the center release screw in until it bottoms.

4. Tighten the jam nut.

5. Repeat steps 2-4 for the other high pressure limiter.

---

**WARNING**

Before lifting, check the lifting equipment for proper installation.

- Never allow riders in the operator’s station while the telescopic handler is lifted.
- Keep everyone a safe distance away from the telescopic handler while it is lifted.
- The telescopic handler may only be lifted without a load on the forks, or without an attachment. Never lift the telescopic handler with attachment other than those stated.
SAHR Parking Brake Releasing Procedure
1. There are unlocking screws on the front and rear sides of the axle. Locate and loosen both unlocking screws (1) and remove the stop washers (3).
2. Turn the unlocking screws (1) fully in.

The Telescopic Handler can now be towed.

SAHR Parking Brake Applying Procedure
1. Loosen the unlocking screws (1) and re-install the stop washers (3).
2. Tighten the unlocking screws against the stop washers.

Hydrostatic Transmission Locking Procedure
1. Loosen the jam nut on a high pressure limiter.
2. Using an Allen wrench, turn the center release screw back out until it stops.
3. Tighten the jam nut.
4. Repeat steps 1-3 for the other high pressure limiter.

THEFT DETERRENTS
Gehl has recorded all major component part numbers and serial numbers. Users should take as many of the following actions as possible to discourage theft, to aid in the recovery in the event the machine is stolen, and to reduce vandalism:

1. Remove keys from unattended machines.
2. Attach, secure, and lock all anti-vandalism and anti-theft devices on the machine.
3. Lock doors of cabs when not in use.
4. Inspect the gates and fences of the equipment storage yard. If possible, keep machines in well-lighted areas. Ask the local law enforcement agency to make frequent checks around the storage and work sites, especially at night, during weekends, and on holidays.
5. Report any theft to your dealer and insurance company. Provide the model and all serial numbers. Request your dealer to forward this information to Gehl Company.

WARNING
Before the Telescopic Handler can be returned to service, the SAHR parking brake must be returned to the applied position, and the hydrostatic transmission high pressure limiters must be locked.
GENERAL INFORMATION

WARNING

NEVER lubricate or service this unit when any part of the machine is in motion. ALWAYS exercise the Mandatory Safety Shutdown Procedure (p. 8 Safety chapter) before lubricating or servicing this equipment.

NOTE: The Maintenance chapter in this manual has provisions for recording the dates and hourmeter readings after lubrication or other service has been performed; use those spaces to keep a log for maintaining a current service interval record. Proper routine lubrication is an important factor in preventing excessive part wear and early failure.

LUBRICANTS

The chart on this page lists the locations, temperature ranges and recommended types of lubricants to be used when servicing this machine. Also refer to the separate engine manual for additional information regarding recommended engine lubricants, quantities required and grades.

SEVERE OPERATING CONDITIONS

If the machine is to be operated uninterrupted at full travel speed over distances greater than five miles at ambient temperatures exceeding 90°F (32°C), then the recommended hydraulic oil shown in the chart to the right should be replaced with oil that has an ISO Viscosity Grade (VG) of 68, SAE 20, or equivalent.

In these severe operating conditions, the drive motor generates more heat and this hydraulic oil will provide the hydrostatic drive components the lubrication needed for proper operation.

NOTE: Refer to “Operator Services” in the Service and Storage chapter of this manual for detailed information regarding periodic checking and replenishing of lubricants.

Hydraulic System Reservoir

Use Mobil DTE 15M, or an equivalent that contains anti-rust, anti-foam and anti-oxidation additives and conforms to ISO VG46. Refer to “Severe Operating Conditions” on this page for additional hydraulic oil specifications.

Capacity: 18 gallons (68 L)

All Grease Fittings

Use No. 2 Lithium-based Grease

Engine Crankcase Oil

-22° -13° -4° 5° 14° 23° 32°F 41° 50° 59° 68° 77° 86°

-30° -25° -20° -15° -10° -5° 0°C 5° 10° 15° 20° 25° 30°

SAE 0W-30
SAE 0W-40
SAE 5W-30
SAE 5W-40
SAE 10W-30
SAE 10W-40
SAE 15W-40
SAE 20W-50

*API Service Classification: CH-4/CG-4/CI-4

Change volume w/o filter: 8 quarts (7.5 L)
Change volume w/ filter: 8.5 quarts (8.0 L)

Diesel Fuel

IMPORTANT: Use diesel fuel with a sulfur content of less than 5,000 PPM. Fuel specified to EN590 or ASTM D975 is strongly recommended. Refer to the engine manual for additional diesel fuel information.

Axle Gear Oil

MobilFluid® 424 (recommended)
API GL5 85W-90 with Wet Brake Additive
(Wet Brake Additive part number L71456)

Front Differential Capacity: 4.0 quarts (3.8 L)
Rear Differential Capacity: 4.0 quarts (3.8 L)
Transfer Case Capacity: Front axle: 8 oz. (0.23 L)
Front Planetary Capacity: 27 oz. (0.8 L)
Rear Planetary Capacity: 30 oz. (0.9 L)

Brake System

Use Sunco Multi-ATF or equivalent
GREASING
Refer to the illustrations and listings for fitting locations. Wipe dirt from the fittings before greasing them to prevent contamination. Replace any missing or damaged fittings. To minimize dirt build-up, avoid excessive greasing.

BASIC MACHINE GREASE FITTING LOCATIONS

Every 50 Hours (or weekly)
Refer to the illustration on the facing page for locations.

GENERAL INFORMATION

This Service and Storage chapter describes procedures to follow for making routine maintenance checks, adjustments and replacements. Most of the procedures are also referred to in the Maintenance chapter of this manual. For engine-related adjustments and servicing procedures, refer to the engine manual provided.

IMPORTANT: Always dispose of waste lubricating oils, anti-freeze and hydraulic fluids according to local regulations or take them to a recycling center for disposal. DO NOT pour them onto the ground or into a drain.

DEALER SERVICES

The following areas of internal components service replacement and operating adjustments should only be by (or under the direction of) an authorized Gehl Telescopic Handler dealer.

IMPORTANT: DO NOT service or repair major components, unless authorized to do so by your Gehl dealer. Any unauthorized repair will void the warranty.

POWERTRAIN COMPONENTS

The engine and hydrostatic transmission are coupled directly to each other. All service routines related to the internal components are precise and critical to proper powertrain operation. The axle differential and planetary ends are sophisticated assemblies that require special know-how and tools for servicing.

IMPORTANT: If any powertrain components are suspected of faulty operation, contact your Gehl dealer for assistance.

HYDRAULIC SYSTEM COMPONENTS

Valves, pumps, motors and cylinders are sophisticated assemblies, which require special know-how and tools for servicing. All cylinders are appropriately designed with particular strokes, diameters, checks and hose connection provisions unique to the machine application requirements. A schematic (Maintenance chapter) can be used as a guide for service reference, as required.

Internal service on any of these components should only be performed by (or under the direction of) an authorized Gehl Telescopic Handler dealer.

PRECAUTIONS

DO NOT perform any maintenance or repair without the owner’s prior authorization. Allow only trained personnel to service the machine.

Warranty repairs can only be done by an authorized Gehl dealer. Dealers know what portions of the machine are covered under the terms of the Gehl Warranty and what portions are covered by other vendor warranties.

When a problem occurs, do not overlook simple causes, such as an empty fuel tank. Check for leaks and broken connections. Make note of any specific symptoms, noises, etc. and contact your local Gehl dealer.

IMPORTANT: Always dispose of waste lubricating oils, anti-freeze and hydraulic fluids according to local regulations or take them to a recycling center for disposal. DO NOT pour them onto the ground or into a drain.

WARNING

BEFORE performing any service on the Telescopic Handler, unless expressly instructed to the contrary, exercise the Mandatory Safety Shutdown Procedure (p. 8, Safety chapter). After service has been performed, BE SURE to restore all guards, shields and covers to their original positions before resuming machine operation.
WARNING

Tilt, lift, and extend cylinders have counterbalance valves. These valves keep hydraulic fluid from entering and exiting the cylinders while they are not being activated, and they are under extremely high pressure. Before removing one of these valves, you ARE REQUIRED to call your Gehl dealer or Gehl Service Department. Failure to do so may result in serious injury or death.

ELECTRICAL COMPONENTS

An electrical system schematic is provided, which includes instrumentation, electrical components and switch connections. It is located at the back of this manual and can be used as a guide for service reference, as required.

OPERATOR SERVICES

Some of the operator-related services will require access to components located inside the superstructure, under shields, hoods and covers. The chart on this page notes the components accessed in each particular area.
Choose a clean, level work area. Make sure you have sufficient room, clearances, and adequate ventilation. Clean the walking and working surfaces. Remove oil, grease and water to eliminate slippery areas. Utilize sand or oil absorbing compound, as necessary, while servicing the Telescopic Handler.

Before starting inspection and repair, move the machine onto a level surface, shut down engine, and release all hydraulic pressure. Always block the boom securely, or lower it to full ground contact. Place all controls in neutral.

Block the tires. Remove the ignition key. Remove only guards or covers that provide needed access. Wipe away excess grease and oil.

Excessively worn or damaged parts can fail and cause injury or death. Replace any cracked or damaged parts. Use only genuine Gehl parts for service.

Use care not to damage machined and polished surfaces. Clean or replace all damaged or painted-over plates and decals that cannot be read.

---

**WARNING**

DO NOT smoke or allow any open flames in the area while checking or servicing hydraulic, battery or fuel systems; all contain highly flammable liquids or explosive gases, which can cause an explosion or fire if ignited.

Wear a face shield when you disassemble spring-loaded components or work with battery acid. Wear a helmet or goggles with special lenses when you weld or cut with a torch.

When working beneath a raised machine, always use blocks, jack-stands or other rigid and stable supports. Wear appropriate protective clothing, gloves, and shoes. Keep feet, clothing, hands and hair away from moving parts.

Always wear safety glasses or goggles for eye protection from electric arcs from shorts, fluids under pressure, and flying debris or loose material when the engine is running or tools are used for grinding or pounding.

NEVER weld on bucket, forks, boom, support frame or ROPS/FOPS without the consent of the manufacturer. These components may be made with metals that require special welding techniques, or with designs that do not allow weld repairs. NEVER cut or weld on fuel lines or tanks.

If repair welding is ever required, BE SURE to attach the ground (-) cable from the welder as close as possible to the area to be repaired. Also, remove battery positive (+) terminal connection before welding.

**WARNING**

NEVER leave guards off or access doors open when the machine is unattended. Keep bystanders away if access doors are open.

**IMPORTANT:** If the machine is operated without the belly pan installed, the hydraulic cooling system will not function properly resulting in hydraulic overheating.

After servicing, check the work performed, that no parts are left over, etc. Install all guards and covers.

---

**Service Every 10 Hours or Daily**

**CHECKING FUEL TANK LEVEL**

After operation each day, the fuel tank should be filled to prevent water from condensing in the tank. To fill, remove the filler cap and add fuel.

**CHECKING ENGINE OIL LEVEL**

With the machine on level ground, and the engine stopped for ten minutes or more, open the right side engine cover and remove the engine dipstick. Wipe it clean, re-insert it and remove to obtain a reading. If the oil level is down, or below the ADD mark, fill with the required amount of oil to bring the level to the FULL mark. See the Lubrication chapter for the type of oil to use.
CHECKING COOLANT LEVEL

With the machine on level ground, open the engine cover. Check that the coolant in the coolant recovery tank is at the cold level if the engine is cold, or the coolant is at the hot level if the engine is hot.

Allow the coolant to cool if hot. Remove the cap and add a low-silicate ethylene glycol based coolant mixed with quality water and supplemental coolant additives (SCAs) suitable for heavy-duty diesel engines to the coolant recovery tank. See the engine manual for additional information. Replace the cap securely.

NOTE: If the engine is operated with a loose radiator cap, the pressure bypass will not work and the engine will run hot.

CHECKING RADIATOR FOR DEBRIS

With the machine on level ground, open the engine cover. Remove the rear radiator cover by turning the two quarter turn latches counterclockwise. Remove the cover by lifting up and to the rear. If necessary, clean the radiator fins of debris by blowing compressed air through the radiator fins from the inside to the outside of the radiator.

CHECKING HYDRAULIC OIL LEVEL

The machine must be on level ground with boom lowered and completely retracted. The fluid MUST be cool when checking the reservoir level, to reduce the possibility of overfilling the hydraulic system.

Open the right side engine cover and locate the sight gauge on the firewall. The oil level should be at the midpoint of the sight gauge. If the oil level is down, or below the sight gauge, fill with the required amount of oil. See the Lubrication chapter for the type of oil to use.

IMPORTANT: Be careful when removing the reservoir filler cap so that no dirt or other foreign matter enters the hydraulic system. DO NOT OVERFILL.

CHECKING BRAKE RESERVOIR LEVEL

Remove the cover on the front of the frame. Remove the reservoir cover to check the fluid level. If low, fill to the proper level with the correct fluid. See the Lubrication chapter for the type of fluid to use.
CHECKING TIRE PRESSURES
Proper tire pressure should be maintained for all four tires to enhance operating stability and extend tire life.

When installing tires on the machine, be sure that all tires are of the same size and style. ALWAYS replace tires with the same size furnished as original equipment. Replacement tires must be purchased locally.

Check the tire pressure “cold.” All 10-ply tires should be inflated to 60 PSI (414 kPa).

When removing tires, follow industry safety practices. Deflate completely prior to removal. After assembly of the tire onto the rim, use a safety cage or restraining device while inflating.

---

**WARNING**

Inflating or servicing tires can be dangerous. Whenever possible, trained personnel should service and mount tires. To avoid possible death or serious injury, follow the safety precautions below:

1. BE SURE the rim is clean and free of rust.
2. Lubricate both the tire beads and rim flanges with a soap solution. DO NOT use oil or grease.
3. DO NOT place your fingers on the tire bead or rim during inflation. Use a clip-on tire chuck with a remote hose and gauge, which allows you to stand clear of the tire while inflating.
4. NEVER inflate beyond 35 psi (240 kPa) to seat the beads. If the beads have not seated by the time the pressure reaches 35 psi (240 kPa), deflate the assembly, reposition the tire on the rim, relubricate both parts and re-inflate. Inflation pressure beyond 35 psi (240 kPa) with unseated beads may break the bead or rim with explosive force sufficient to cause death or serious injury.
5. After seating the beads, adjust the inflation pressure to the recommended operating pressure listed.
6. DO NOT weld, braze, or otherwise attempt to repair and use a damaged rim.

---

CHECKING WHEEL NUT TORQUE
On new machines, or any time a wheel has been removed, re-torque until 450 ft.-lbs. (610 Nm) is maintained.

CHECKING INSTRUMENTS OPERATION
Allow the engine to warm up for about five minutes before beginning operation. Indicator lamps should be OFF and gauges should register normal readings.

CHECKING GENERAL MACHINE OPERATION AND CONDITION
Are any decals missing or damaged? Are all guards, shields and covers in place? Do all controls function smoothly and properly? Are there any abnormal vibrations or noises? Are any hose or fitting connections leaking? Is the engine exhaust color normal?

---

**WARNING**

Manufacturers of push-pull control cables advise taking the following operation and maintenance precautions:

Do not adjust the control cable with the engine running.

A gradual or sudden increase in the no-load friction (cable disconnected at both ends) of a control cable is an indication of an impending or present performance problem. The control cable should be replaced.

A gradual or sudden decrease in the useable travel is a indication of an impending or present performance problem. The cable should be replaced.

Control cables that have moisture inside of them and/or have frozen should be replaced. Do not apply heat to dry or thaw control cables.

Control cables are lubricated for the life of the control cable. Do not remove the seals or lubricate the control cable.

Control cables are designed to be non-repairable. Do not attempt to repair control cables.

Failure to heed could result in death or serious injury.
LUBRICATING GREASE POINTS
Refer to the Lubrication chapter of this manual for weekly grease fitting locations and other related details.

CHECKING FUEL FILTER
NOTE: The fuel filter will require occasional replacement to maintain a clean and adequate fuel flow for maximum engine horsepower. The frequency of filter replacement will be determined by the cleanliness of available fuel, the care used in storing fuel supplies and the operating conditions in which the machine is used.

Small amounts of water can be drained from the fuel filter. Loosen the drain screw to drain water accumulation until clear fuel is flowing.

The following initial oil and filter changes should be made at 100 hours on a new machine. Thereafter these changes should be made at the regular maintenance schedule listed below. Refer to those schedules for the necessary procedures.

<table>
<thead>

<tr>
<td>NOTE: The planetary hubs can be checked without jacking up the machine.</td>
</tr>
</tbody>
</table>
The planetary hubs have one plug each used for filling and draining. Refer to illustration above. For checking the level and filling, position the wheel until the oil level arrow is horizontal. Remove the plug. If oil does not run out, add oil until it overflows. Check the remaining hubs the same way. Refer to the oil specifications in the Lubrication chapter of this manual.

**CHANGING ENGINE OIL AND FILTER**

Change the engine oil and filter using the following procedure:

1. With the engine warm, open the cover under the engine to access the drain plug. Remove the crankcase drain plug.

**IMPORTANT:** **DO NOT** discharge oil onto ground. Catch and dispose of per local waste disposal regulations.

2. The engine oil filter should be changed at every oil change interval. Remove and discard the disposable filter. Wipe the gasket sealing area of the block with a clean cloth.

**IMPORTANT:** Use only genuine OEM engine replacement filters.

3. Apply a thin coat of clean oil to the new oil filter gasket. Hand tighten. Refill the crankcase with new oil. Follow specifications in the Lubrication chapter for type and viscosity of new oil.

4. After new oil has been added, run the engine at idle speed until the oil pressure lamp is OFF. Check for leaks at the filter and drain plug. Retighten only as much as necessary to eliminate leakage.

**CHECKING THE BATTERY**

The battery furnished in the machine is a 12-volt, wet-cell battery.

**Handling Battery Safely**

The top of the battery must always be kept clean. Clean the battery with a brush dipped in an alkaline solution (ammonia or baking soda and water). After the foaming has stopped, flush the top of the battery with clean water. If the terminals and cable connection clamps are corroded or have a buildup, disconnect the cables and clean the terminals and clamps with the same alkaline solution.

---

**WARNING**

Explosive gas is produced while a battery is in use or being charged. Keep flames or sparks away from the battery area. Make sure battery is charged in a well-ventilated area.

NEVER lay a metal object on top of a battery, because a short circuit can result.

Battery acid is harmful on contact with skin and fabrics. If acid spills, follow these first-aid tips:

1. **IMMEDIATELY** remove any clothing on which acid spills.

2. If acid contacts the skin, rinse the affected area with running water for 10 to 15 minutes.

3. If acid comes in contact with the eyes, flood the eyes with running water for 10 to 15 minutes. See a doctor at once. NEVER use any medication or eye drops unless prescribed by a doctor.

4. To neutralize acid spilled on the floor, use one of the following mixtures:
   - 1 pound (0.5 kg) of baking soda in 4 quarts (4 liters) of water.
   - 1 pint (0.4 liters) of household ammonia in 4 quarts (4 liters) of water.

Whenever battery is removed from the unit, **BE SURE** to disconnect the negative (-) battery terminal connection first.

**Jump Starting**

If the battery becomes discharged or does not have enough power to start the engine, use jumper cables and the following procedure to jump-start the engine.

**IMPORTANT:** **BE SURE** that the jumper battery is also a 12-volt D. C. battery, and the vehicle used for jump starting has a negative-ground electrical system.
**WARNING**

The ONLY safe method for jump-starting a discharged battery is for TWO PEOPLE to perform the following procedure. The second person is needed for removing the jumper cables so that the operator does not have to leave the operator’s compartment while the engine is running. NEVER connect the jumper cables directly to the starter solenoid of either engine. DO NOT start the engine from any position other than the operator’s seat, and then ONLY after making sure all controls are in “neutral.”

Closely follow the jump-start procedures, in the order listed, to avoid personal injury. In addition, wear safety glasses to protect your eyes, and avoid leaning over the batteries while jump-starting.

**DO NOT** attempt to jump-start the machine if the battery is frozen, because this may cause it to rupture or explode.

1. Turn the key switches on both vehicles to “OFF.” Be sure that both vehicles are in “Neutral” and NOT touching.

2. Connect one end of the positive (+) jumper cable to the positive (+) battery terminal on the disabled machine first. DO NOT allow the positive (+) jumper cable clamps to touch any metal other than the positive (+) battery terminals. Connect the other end of the positive jumper cable to the jumper battery positive (+) terminal.

3. Connect one end of the negative (-) jumper cable to the jumper battery negative (-) terminal.

4. Make the final negative (-) jumper cable connection to the disabled machine’s engine block or frame (ground) – NOT to the disabled battery negative post. If making the connection to the engine, keep the jumper clamp away from the battery, fuel lines, and moving parts.

**NOTE:** Twist the jumper cable clamps on the battery terminals to ensure a good electrical connection.

5. Proceed to start the machine. If it does not start immediately, start the jumper vehicle engine to avoid excessive drain on the booster battery.

6. After the machine is started and running smoothly, have the second person remove the jumper cables (negative (-) jumper cable first) from the jumper vehicle battery, and then from the disabled machine, while ensuring NOT to short the two cables together.

Allow sufficient time for the alternator to build up a charge in the battery before operating the machine or shutting off the engine.

**NOTE:** If the battery frequently becomes discharged, have the battery checked for possible dead cells, or troubleshoot the electrical system for possible short circuits or damaged wire insulation.

**CHECKING BOOM SLIDE PADS WEAR AND CLEARANCE**

The boom is equipped with special nylon low friction slide pads between the telescopic sections. (See illustration.) These are pre-greased and initially worn-in at the factory. Normally greasing is not required, except for maintaining a light film of grease on the pad tracking areas of the boom sections. An exception would be if a boom section has been replaced.

Visually check for loose pad bolts. The bolts are torqued to 30 ft.-lbs. (40 Nm). If the bolts are re-torqued at any time, Loctite® 271 (red) thread lock must be re-applied to the bolts.

If the boom starts to chatter under load, grease the slide pads and wipe off the excess. If a top or side slide pad shows excessive wear, loosen bolts and insert shims to each side or top and bottom for even distribution of...
clearance. Re-apply Loctite® 271 (red) thread lock to the bolts and re-torque to 30 ft.-lbs. (40 Nm). Bottom slide pads should be replaced when the thickness is worn down to 3/8” (9.5 mm).

![Fuel Bleeding Procedures](image)

**WARNING**

Failure to maintain proper slide pad clearance and thickness could cause damage to the boom and result in sudden boom failure.

**Service Every 500 Hours or Half Year**

Perform all other service requirements up to this point, as well as the following:

**CHANGING FUEL FILTER**

The frequency of filter replacement will be determined by the cleanliness of available fuel, the care used in storing fuel supplies and the operating conditions in which the machine is used.

![Changing Fuel Filter](image)

**WARNING**

NEVER service the fuel system while smoking, while near an open flame, or after the engine has been operated and is hot.

1. Place suitable container under the fuel filter to catch any fuel.
2. Unscrew filter cartridge to remove.
3. Clean sealing surface of the filter head.
4. Apply a light coat of oil or diesel fuel to the rubber gasket on the new filter cartridge.
5. Screw the filter on by hand until the seal contacts the head. Then tighten the filter an additional half turn.
6. Start the engine and check for leaks.

Normally it is not necessary to bleed the air out of the fuel system after changing the fuel filter.

If it is necessary to bleed the fuel system, proceed with the following fuel bleeding procedure or refer to the engine manual.

**Fuel Bleeding Procedures**

If the engine runs out of fuel or the fuel system needs to be bled, refer to the following fuel bleeding procedure. Refer to the engine manual for additional fuel bleeding procedures.

1. Place suitable container under the fuel filter to catch any fuel.
2. Loosen bleed screw (1).
3. Operate the fuel supply pump primer lever (2) until fuel flows from the bleed screw (1) without bubbles.
4. Tighten the bleed screw.

5. Dispose of any collected fuel per local waste disposal regulations.
6. Start the engine and check for fuel leaks.

If the engine will not start, repeat steps 2-4, or consult your authorized engine dealer.

**WARNING**

Escaping diesel fuel under pressure can have sufficient force to penetrate the skin. Before applying pressure to the fuel system, BE SURE all connections are tight and lines and hoses are not damaged. Use a piece of wood or cardboard to search for suspected leaks. If injured by escaping fuel, see a doctor familiar with this type of injury at once or gangrene may result.

**NOTE:** Only an authorized engine dealer can perform warranty service on the engine.
Diesel Fuel Injectors
Whenever faulty or plugged injectors are indicated, see your authorized engine dealer.

Diesel Injection Pump Timing
Whenever injection pump timing, or other pump service is indicated by abnormal engine operation, contact your engine dealer.

CHECKING AND CHANGING HYDRAULIC RETURN FILTER ELEMENT

WARNING
Before servicing the hydraulic filter, lower the boom to the ground.

When checking the filter indicator, STAY CLEAR of any rotating parts. Contact with rotating parts will cause serious injury.

This spin-on type hydraulic filter element is accessible from under the engine cover. Initial replacement is after the first 100 hours. To check the hydraulic filter element, run the engine at full throttle and normal operating temperature. Have an assistant lift the engine cover to observe the hydraulic filter indicator located on the filter head. If the indicator is green, the filter does not need replacing. If the indicator is red, replace the filter following the instructions below:

1. Turn off the engine.
2. Spin off the old hydraulic filter element.
3. Wipe the gasket sealing surface of the filter head with a clean cloth.
4. Apply a thin coat of clean oil to the new filter gasket.

5. Spin on the new filter element and hand tighten.
6. Run the engine at full throttle and check for leaks at the filter sealing area.

Service Every 1000 Hours or Yearly

Perform all other service requirements up to this point, as well as the following:

CHECKING AND CHANGING AIR FILTER ELEMENTS

IMPORTANT: Failure to follow proper filter servicing instructions could result in catastrophic engine damage.

The air cleaner assembly consists of an outer (primary) filter element and an inner (safety) filter element. An air filter restriction indicator for monitoring the condition of the elements is located in the rubber elbow at the rear of the air cleaner. If the air filter becomes restricted, this indicator turns red to warn that the air cleaner requires service. Push the reset button located at the end of the indicator after replacing the element.

NOTE: Before replacing the filter element(s), push the reset button on the indicator. Start the engine and run at full throttle. If the indicator does not turn red, do not replace the element(s).

The outer element should be replaced only when the restriction indicator turns red. The inner element should be replaced every third time the outer element is replaced, unless the outer element is damaged or the inner element is visibly dirty. Along with a daily check of the restriction indicator, check that the air cleaner intake hose and clamps, and the mounting bracket hardware are properly secure.
1. Unlatch the three latches on the air cleaner and remove the cover. Clean out any dirt in the cover assembly.

2. Carefully pull the outer element out of the housing. Never remove the inner element unless it is to be replaced.

3. Clean out any dirt in the housing. Leave the inner element installed during this step to prevent debris from entering the engine intake manifold.

4. Use a trouble light inside the new outer element to inspect for bad spots, pinholes and ruptures.

**IMPORTANT:** _NEVER_ use an element that is damaged. Severe engine wear and eventual failure can result if dirt gets through a hole in the element. Cleaning the outer element is not recommended.

**NOTE:** Replace the inner element only if it is visibly dirty or if the outer element has been replaced three times.

Before removing the inner element from the housing, clean out any dirt built up in the housing. Leave the inner element installed during this step to prevent debris from entering the engine intake manifold. Remove the inner element.

5. Check the inside of the housing for any damage that may interfere with the elements.

6. Be sure that the element sealing surfaces are clean.

7. Insert the element(s), making sure that they are seated properly.

8. Secure the cover to the housing with the three clamps.

9. Check the hose connections and make sure they are all clamped and tightened properly.

**CHANGING AXLE DIFFERENTIAL AND PLANETARY OIL**

**Differentials**

1. Remove the check/fill plug. Remove the drain plug and drain out the old oil. Replace the drain plug (see illustration).

**IMPORTANT:** _DO NOT_ discharge oil onto ground. _Catch and dispose of per local waste disposal regulations._

2. Fill the differential with oil as specified in the Lubrication chapter. When the oil flows from the check hole, replace the plug. Wait 10 to 15 minutes and repeat this process until the axle is full. Repeat this procedure with the other axle.

**Front Axle Transfer Case**

1. Remove the check/fill plug. Remove the drain plug and drain out the old oil. Replace the drain plug (see illustration).

**IMPORTANT:** _DO NOT_ discharge oil onto ground. _Catch and dispose of per local waste disposal regulations._

2. Fill the transfer case with oil as specified in the Lubrication chapter. When the oil flows from the check hole, replace the plug. Wait 10 to 15 minutes and repeat this process until the transfer case is full.

**Axle Planetary Hubs**

The hubs have one plug each used for draining and filling (see illustration).

1. Position the wheel until the oil level arrow points down. Remove the plug and allow the oil to drain out. Replace the plug.

**IMPORTANT:** _DO NOT_ discharge oil onto ground. _Catch and dispose of per local waste disposal regulations._
2. Re-position the hub so the oil level arrow is horizontal. Fill with clean oil as specified in the Lubrication chapter. When the oil runs out, install the drain/fill plug. Repeat this procedure on the other three hubs.

**CHECKING ALTERNATOR AND FAN BELT CONDITION**

Refer to the engine manual for proper belt tension adjustment and replacement procedures. If the belt shows wear or cuts, or cracks, it should be replaced. Order replacement belt from your engine dealer.

**CHECKING EXHAUST SYSTEM**

Examine the muffler and tail pipe for possible holes. Re-tighten any loose clamps and make sure the manifold outlet gasket is not leaking. Examine the exhaust insulating blanket for holes or tears. To prevent excessive heat build up in the engine compartment the insulating blanket should be replaced when it is damaged.

**IMPORTANT:** To prevent damaging the insulating blanket, do not spray it with high pressure water blast when cleaning the engine.

**CHECKING FUEL TANK CONDENSATION**

A drain plug is provided in the bottom of the fuel tank for removing condensation and other foreign materials. Open the plug and allow water and fuel to drain into a container until only clear fuel is flowing from the tank. Perform all other service requirements up to this point, as well as the following.

**CHECKING HYDRAULIC SYSTEM RELIEF PRESSURES**

Pressure settings for relief valves are pre-set at the factory. A test port is provided under the engine cover. Before conducting any test port pressure checks, check the engine speed. Engine speed must be 1100 RPM at idle and 2500 to 2750 RPM at high idle.

**Steering Relief Pressure**

Plug a 3000 psi (207 bar) oil- or liquid-filled gauge into the test port. Turn the steering wheel fully to the right or left. The gauge should read 2400 psi (165 bar).

**Main Relief Pressure**

Plug a 3500 psi (241 bar) oil- or liquid-filled gauge into the test port. Fully retract the boom forcing oil to flow over the relief valve. The gauge should read 3350 psi (231 bar).

**CHANGING HYDRAULIC RESERVOIR OIL**

Clean all dirt and debris from around the drain plug area.

1. Remove the drain plug and drain out all used oil. Wash or blow off all collected particles from the magnetic drain plug.

**IMPORTANT:** Do NOT discharge oil onto ground. Catch and dispose of per local waste disposal regulations.

2. Flush out the bottom of the tank with clean hydraulic oil. Re-install the drain plug.

3. Fill the tank with fresh oil. Follow specifications found in Lubrication chapter of this manual.

**IMPORTANT:** Hydraulic fluid and filters should be replaced any time contamination is present before the normally scheduled change.

---

**WARNING**

Escaping hydraulic oil under pressure can have sufficient force to penetrate the skin. Before applying pressure to the hydraulic system, be sure all connections are tight and lines and hoses are not damaged. Use a piece of wood or cardboard to search for suspected leaks. If injured by escaping hydraulic oil, see a doctor familiar with this type of injury at once or gangrene may result.
CHANGING RADIATOR COOLANT

Drain, flush and refill the cooling system as follows:

**IMPORTANT: DO NOT discharge coolant onto ground. Catch and dispose of per local waste disposal regulations.**

1. Loosen the radiator cap to its stop. This will release any system pressure. Remove the cap when all pressure is bled off.

2. Open the oil drain access cover.

3. Attach a 3/8” by 26” long hose to the drain cock and run it out through the oil drain access cover.

4. Loosen the radiator drain cock. Remove the water jacket drain plug from the engine block. When all coolant is drained, flush the system with clean fresh water. Allow the radiator and engine to drain completely.

5. Replace all drain plugs and tighten the radiator drain cock. Clean the cooling fins in the radiator with water pressure or steam.

**IMPORTANT: Fill the cooling system with a low-silicate ethylene glycol based coolant mixed with quality water and supplemental coolant additives (SCAs) suitable for heavy-duty diesel engines. See the engine manual for additional information.**

4. Inspect the radiator cap seal before installing it. Replace it if it appears to be damaged. The 15 psi (100 kPa) pressure cap and engine thermostat work in conjunction with each other to maintain proper engine cooling.

**NOTE: Check the engine temperature gauge every minute or two after coolant has been changed. Air pockets can form and it may be necessary to refill the cooling system after a short period of use, as the air bleeds out of the system.**

STORING THE MACHINE

If the Telescopic Handler will not be operated for a period of three months or more, prepare and store it using the following procedure:

**NOTE: If the storage area is outdoors or in a harsh environment, the storage procedure should be followed if the Telescopic Handler is to be stored for one month.**

Before Storage

Perform the following prior to placing the machine in storage:

1. Wash off the entire machine.

2. Lubricate all grease fittings as described in the Lubrication chapter of this manual.

3. Change engine oil as outlined in the Service and Storage chapter of this manual.

4. If the machine will not be operated for a month or longer, apply grease to all exposed hydraulic cylinder rod areas.

5. Disconnect the battery cable clamps and cover the battery or remove the battery from the machine and store it separately.

6. If the ambient temperature (at any time during the storage period) is expected to drop below freezing, make sure the engine coolant is either completely drained from the radiator and engine block or that the amount of anti-freeze in it is adequate to keep the coolant from freezing. Refer to the engine manual for anti-freeze recommendations and quantities.

**WARNING**

Remove the radiator cap only when the engine is cool, or painful burns could result.
During Storage
1. About once each month, connect the battery and check all fluid levels to make sure they are at the proper level before starting the engine.
2. Start the engine and allow it to run until it warms up and then move the machine a short distance to help relubricate the internal parts. Run the engine until the battery has a chance to recharge and then shut it off.

IMPORTANT: If it is desired to operate the hydraulic cylinders at this time, BE SURE to wipe the protective grease (and any adhering dirt) from the cylinder rods prior to starting the engine. After operating, BE SURE to recoat the cylinder rods with grease if the machine is to be returned to storage.

After Storage
After removing the machine from storage and before operating it, perform the following:

1. Change engine oil and filter to remove condensation or other residues.
2. Wipe off grease from cylinder rods.
3. Lubricate ALL grease fittings.
4. Review and re-familiarize yourself with all safety precautions as outlined in the Safety chapter of this manual.
5. Follow the starting and warm-up procedures as outlined in the Operation and Adjustments chapter of this manual.
GENERAL INFORMATION

CAUTION

ALWAYS read and follow the safety precautions and information shown on decals. If any decals are damaged or unreadable, or if the unit is repainted, the decals must be replaced. If repainting, BE SURE that all decals that apply to your machine are affixed in their proper locations.

When a decal is applied on a part that is to be replaced, make sure that the replacement part has the decal applied or apply a new decal.

Decal location information is provided to assist in the proper selection and application of new decals, in the event the original decals become damaged or the machine is repainted.

For correct replacement of decals, compare the location photographs to the machine before starting to refinish the unit. Check off each required decal using the illustration reference number to find the part number, description and quantity in the list. Refer to the appropriate illustration for replacement locations.

NOTE: Refer to the Safety chapter of this manual for the specific information provided on the various safety decals.

NEW DECAL APPLICATION

Before applying new decals, surfaces must be free from dirt, dust, grease and other foreign material. To apply a solid-formed decal, remove the smaller portion of the decal backing paper and apply this part of the exposed adhesive backing to the clean surface while maintaining proper position and alignment. Slowly peel off the other portion of the backing paper while applying hand pressure to smooth out decal surface. To apply a die-cut decal, first remove the backing paper. Then, properly position the decal onto the clean mounting surface. After the decal is firmly applied and smoothly pressed down, remove the front covering paper.

PAINT FINISH

Use this list to order paint for refinishing:

184768 One Gallon Yellow
167789 6 (12-oz. Spray Cans) Yellow
167754 One Gallon Gun-Metal Gray
167753 6 (12-oz. Spray Cans) Gun-Metal Gray

Decal Kits

104353 RS5-19 Telescopic Handler

NOTE: Decals may be purchased in kits or individually.

# Chapter 10

## MAINTENANCE

This Maintenance Interval Chart was developed to match the Service and Storage chapter of this manual. Detailed information on each service procedure are in the Service and Storage chapter. A Maintenance Log follows the Maintenance Interval Chart for recording the maintenance procedures performed. Recording the 10-Hour (or Daily) service procedures would be impractical and is therefore not recommended.

**IMPORTANT:** Under extreme operating conditions, more frequent service than the recommended intervals may be required. You must decide if your operation requires more frequent service.

GEHL COMPANY
WARRANTY

GEHL COMPANY, hereinafter referred to as Gehl, warrants new Gehl equipment to the Original Retail Purchaser to be free from defects in material and workmanship for a period of twelve (12) months from the Warranty Start Date.

GEHL WARRANTY SERVICE INCLUDES:

Genuine Gehl parts and labor costs required to repair or replace equipment at the selling dealer's business location.

GEHL MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED (INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSE), EXCEPT AS EXPRESSLY STATED IN THIS WARRANTY STATEMENT.

ANY OF THESE LIMITATIONS EXCLUDED BY LOCAL LAW SHALL BE DEEMED DELETED FROM THIS WARRANTY; ALL OTHER TERMS WILL CONTINUE TO APPLY.

SOME STATES DO NOT PERMIT THE EXCLUSION OR LIMITATION OF THESE WARRANTIES AND YOU MAY HAVE GREATER RIGHTS UNDER YOUR STATE LAW.

GEHL WARRANTY DOES NOT INCLUDE:

1. Transportation to selling dealer's business location or, at the option of the Original Retail Purchaser, the cost of a service call.

2. Used equipment.

3. Components covered by their own non-Gehl warranties, such as tires, batteries, trade accessories and engines.

4. Normal maintenance service and expendable, high-wear items.

5. Repairs or adjustments caused by: improper use; failure to follow recommended maintenance procedures; use of unauthorized attachments; accident or other casualty.

6. Liability for incidental or consequential damages of any type, including, but not limited to lost profits or expenses of acquiring replacement equipment.

No agent, employee or representative of Gehl has any authority to bind Gehl to any warranty except as specifically set forth herein.
Do not start, operate or work on this machine until you have carefully read and thoroughly understand the contents of the operator’s manual.

Failure to follow safety, operating and maintenance instructions could result in serious injury to the operator or bystanders, poor operation, and costly breakdowns.

If you have any questions on proper operation, adjustment or maintenance of this machine, contact your dealer or the service department of Gehl Company before starting or continuing operation.

California Proposition 65 Warnings
Diesel engine exhaust and some of its constituents are known to the State of California to cause cancer and birth defects or other reproductive harm.

Battery posts, terminals and related accessories contain lead and lead compounds, chemicals known to the State of California to cause cancer and birth defects or other reproductive harm. Wash hands after handling battery.
